

Task 1: H.I

- [1] Hi, my name is Muhammad Ahmad, and I am a passionate software developer, currently I am pursuing BTech degree from Marwadi University - ICT department at 2027. I have interest to go with cloud domain, I believe that by next 10-15 years most business / companies will be going cloud based, no one want to be for premises, also it means there will be huge gap for cloud engineers. Hence that I have created roadmap for that, I have start to learn basics of cloud system and distributed system; networking, infrastructure management; operating systems, linux, server management, command line interface (CLI), web development concepts; Data Structure & Algorithm, APIs; powershell. This is long carrier; but for short carrier I have started to learn web development & mobile App developing (using flutter), because it's easier to find job as mobile App and there is demand on market. I also planning to get CCNA from cisco this year and also AWS practitioner certificate before feb 2027, so before I get 8th semester I planned to certified AWS cloud cloud practitioner with basic knowledge as CCNA. The journey is long but

- [2] While on behalf on me, "I'm passionate software developer, I am pursuing my Btech in 2027, I planning to be cloud engineer, I have my roadmap, I have learn linux system, networking, infrastructure, This is long term plan. But for now I am learning mobile App developing using flutter, I think it

is easier to find job in this domain, also I want to cover my CNA and AWS cloud practitioner exam fees".

"I am passionate software developer currently pursuing my B.Tech, set to graduate in 2027. My long-term goal is to become a cloud engineer, and I have already laid out a clear road map to reach that destination. As part of my preparation, I've been learning essential technologies like Linux systems, networking fundamentals & infrastructure management. These skills form the backbone of my future in cloud computing, and I'm committed to mastering them over time. While cloud engineering is my long-term vision, I'm currently focused on mobile app development using Flutter. I find Flutter to be a powerful & efficient framework, and I believe it offers better job opportunities in the short term. Developing apps with Flutter allows me to build real-world projects, strengthen my programming fundamentals, and gain practical experience that's highly valued in today's tech industry.

To support my career growth, I'm also planning to earn certifications like the CNA & AWS cloud practitioner. These credentials will validate my skills & open doors to more advanced roles in networking & cloud services. However, covering the exam fees is a challenge I'm working to overcome, and I'm exploring

ways to send these certifications while continuing my learning journey.

Overall, I'm driven by curiosity, persistence, and a clear sense of purpose. Whether it's building mobile apps or preparing for cloud certifications, I approach every step with dedication & desire to grow. My journey is just beginning, but I'm excited about the path I've chosen & the opportunities ahead".

- Educator mindset, showing knowledge, clean architecture, my precise location (Rajkot).
- Desire to create meaningful and scalable apps.
- UI/UX design and user experience awareness.
- pursuing B.Tech from ICT - Morvadi.
- web development
- Distributed system as long-term goal.
- powershell, CLI skills
- Importance of cloud & future aspects.

~~Self~~ Observation

My writing focus on technical skills, Road map and career milestones, on other hand, the GPT gave output that focus more of narrative flow and add some details I have not mentioned, but I have asked before.

The key observation is, whatever you are seeking or will not come as your expecting, it will miss some details and add others.
